Introduction

- Neural networks provide state-of-the-art results within various fields of research.
 - But, often overparameterization results in an excessive usage of memory and computations.
 - One solution to this issue is pruning.
 - The technique presented here merges highly correlated neurons, while maintaining the accuracy obtained by the network.
-
- Fun fact: Pruning is naturally occurring in the brains of (especially) babies.

NoiseOut:

procedure Train(X,Y):

W \leftarrow initialize_weights()

for each iteration **do**:

Y_N \leftarrow generate_random_noise()

Y' \leftarrow concatenate(Y, Y_N)

W \leftarrow back_prob(X, Y')

while cost(W) \leq threshold:

A, B \leftarrow find_most_correlated_neurons(W, X)

$\alpha, \beta \leftarrow$ estimate_parameters(W, X, A, B)

W' \leftarrow remove_neurons(W, A)

W' \leftarrow adjust_weights(W', B, α, β)

W \leftarrow W'

return W

Pruning of a single neuron:

1. For each i, j, l calculate $\rho(h_i^{(l)}, h_j^{(l)})$
 2. Find $u, v, l = \arg \max |\rho(h_i^{(l)}, h_j^{(l)})|$
 3. Calculate $\alpha, \beta := \arg \min (h_u^{(l)} - \alpha h_v^{(l)} - \beta)$
 4. Remove neuron u in layer l
 5. For each neuron k in layer $l + 1$:
 - Update the weight $w_{v,k}^{(l)} = w_{v,k}^{(l)} + \alpha w_{u,k}^{(l)}$
 - Update the bias $b_k^{(l+1)} = b_k^{(l+1)} + \beta w_u^{(l)}$
-

Basic introduction to artificial neural networks

Proposed method

Encouraging correlations between neurons

Experiments

Conclusion

Encouraging correlations between neurons

- Correlations between the neurons is a key factor in pruning the network.
- Correlations are increased by adding *noise outputs*.
- Three noise models have been investigated: Binomial, Gaussian and Constant. These models were tested versus the non-noise case.
- The results only show correlation, not model improvement.

Experiments

Table 1: Pruning Lenet-300-100 on MNIST. In all of the experiments the error rate is 3.05%

Method	Noise Neurons	Layer 1 Neurons	Layer 2 Neurons	Parameters	Removed Parameters	Compression Rate
Ground Truth	-	300	100	266610	-	-
No_Noise	-	23	14	15989	94.00%	16.67
Gaussian	512	20	9	15927	94.02%	16.73
Constant	512	20	7	15105	94.33%	17.65
Binomial	512	19	6	11225	95.78%	23.75
No_Noise	-	13	12	10503	96.06%	20.89
Gaussian	1024	16	7	12759	95.21%	18.58
Constant	1024	18	7	14343	94.62%	17.61
Binomial	1024	19	7	15135	94.32%	25.38

Table 2: Pruning a convolutional network trained on SVHN dataset with 93.39% accuracy

Method	Dense Layer Neurons	Parameters	Removed Parameters
Ground Truth	1024	1236250	-
No_Noise	132	313030	74.67%
Gaussian	4	180550	85.39%
Constant	25	202285	83.63%
Bionomial	17	194005	84.30%

Table 3: Pruning Lenet-5 on MNIST. In all of the experiments the error rate is 0.95%

Method	Dense Layer Neurons	Parameters	Removed Parameters
Ground Truth	512	605546	-
No_Noise	313	374109	38.21%
Gaussian	3	13579	97.75%
Constant	33	48469	91.99%
Bionomial	26	40328	93.34%

M. Babaeizadeh
et al., *NoiseOut: A Simple Way to Prune Neural Networks*, 29th Conference on Neural Information Processing Systems (NIPS 2016)

Conclusion

- Introduction of noise outputs can increase the correlation between neurons in the hidden layers.
- Pruning according to this scheme can drastically decrease the number of neurons while maintaining accuracy for highly performing networks.
- Without decreasing accuracy for the MNIST dataset:
 - the number of parameters were decreased by 96% for the LeNet-300-100 network.
 - the number of parameters were decreased by 98% for the LeNet-5 network.
